Screening, Brief Intervention and Referral to Treatment (SBIRT)
Key components

Screening
A very brief set of questions that identifies the risk of substance use disorder (SUD) related problems
• It should be 5 to 10 minutes long.
• Reimbursement requires the use of validated screening instruments.

Brief Intervention (BI)
A short (5 to 30 minutes long) counseling session that raises awareness of risks and motivates the client toward acknowledgment of the problem

Referral to Treatment
Procedures to help the member access specialized treatment.
Potential benefits

Positively affects

- Patients with SUDs
- Patient morbidity and mortality rates

Reduces

- Health care costs
- Work impairment and incidents of driving under the influence

Improves

- Neonatal outcomes
Potential benefits for practices

**Awareness**
- Increases clinicians’ awareness of substance use issues

**Better approach**
- Offers clinicians a more systematic approach to addressing substance use and makes it less of a judgment call
Example

- Alcohol use/dependence in past 12 months: 3%
- Heavy drinking, but no alcohol use/dependence in past 12 months: 23%
- No alcohol use/dependence or heavy drinking in past 12 months: 74%

Referral to treatment

Brief intervention
Decision tree (example)

Alcohol: Women = 0-2
Men = 0-4

Alcohol: Women = 4+
Men = 5+

Other drugs: Any yes

Other drugs: All no

Alcohol screen complete

Administer the AUDIT

Administer the DAST

Other drug screen complete

Low/no risk:
Alcohol = 0-7
Other drugs = 0

At risk:
Alcohol = 8-15
Other drugs = 1-2

Mod/high risk:
Alcohol = 16-19
Other drugs = 3-5

High/severe risk:
Alcohol = 20-40
Other drugs = 6-10

Reinforce behavior; monitor

BI goal: lower risk; reduce use to acceptable levels.

BI/referral to treatment/BT goal: encourage patient to accept a referral or engage in BT. *

Referral to treatment

goal: Encourage patient to accept referral or engage in BT.

* Brief treatment.
Screening tools

Characteristics of a useful screening tool:
• Brief (10 or fewer questions)
• Flexible
• Easy to administer and easy for the patient
• Addresses alcohol and other drug use
• Indicates the need for further assessment or intervention
• Has good sensitivity and specificity

Chart and table data via National Institute on Alcohol Abuse and Alcoholism.
Prescreening is a quick approach to identifying people who need to do a more extended screen and BI.

- **Self-reported:**
  - 1 to 4 questions

- **Biological:**
  - Blood alcohol level test
Alcohol prescreening question

National Institute on Alcohol Abuse and Alcoholism one-item screen for alcohol use:

• “How many times in the past year have you had X or more drinks in a day?”
  o See “risk” table (slide 11) for the number of drinks.
    ▪ This identifies unhealthy alcohol use.

• A positive screen is equal to more than one drink.
Drug use prescreening question

National Institute on Drug Abuse one-item screen for illicit drug use:

• “How many times in the past year have you used an illegal drug or used a prescription medication for nonmedical reasons?”
  o This identifies overall use.
• A positive screen is equal to one or more drink.

Does SBIRT work?
Project TrEAT: Trial of Early Alcohol Treatment

- The program included: 17 primary care practices comprised of 64 physicians within 10 Wisconsin counties.
- Approximately 18,000 patients were screened:
  - Around 500 men and 300 women screened positive for at-risk drinking.
  - They were randomized into two groups of approximately 400 each and followed for 48 months.
- Both the control and intervention group received a general health booklet with information about seat belt use, immunizations, exercise, tobacco, alcohol and drugs.
- The intervention group also received two 10-15 minute sessions by a PCP using a scripted workbook.

*Brief Physician Advice for Problem Alcohol Drinkers: A Randomized Controlled Trial in Community-Based Primary Care Practices.* JAMA. 1997;277(13):1039-104.
Heavy drinkers were defined as men who drank > 20 standard drinks and women who drank > 13 standard drinks in the previous seven days.

** Difference statistically significant.
* Binge drinkers were defined as people who drank > 5 drinks within one day in the previous 30 days.

** Difference statistically significant.
Health care utilization analysis at 48 months

Key resources

• Substance Abuse and Mental Health Services Administration (SAMHSA)
• Centers for Medicare and Medicaid Services (CMS)
Summary

- Screening, Brief Intervention and Referral to Treatment:
  - Saves lives.
  - Saves time.
  - Saves money.
- Screening and brief interventions (BIs) are both very effective for alcohol use.
- Screening is very effective for identifying illicit drug use:
  - BI is not effective for drug use.
  - RT (referral to treatment) should follow a positive screening.
